```
sequence shown separated by 0-13 base pairs. Some of these sequences are found near the origin of replication of certain animal viruses and animal claud near the origin of replication of certain animal viruses and animal thousen watent forms of p53 protein which are commonly found in human thumours do not have the ability to bind to these sequences. Thus a function of p53 may be mediated by its ability to bind specific DNA sequences in the human spenome. The sequence shown is a consensus sequence for p53 DNA binding. When inserted upstream and adjacent to a reporter for p53 DNA binding. When inserted upstream and adjacent to a reporter construct could be used for diagnosis of p53 mutations and onset and development of various cancers. The construct may also be used to screen potential chemotherapeutic agents and to identify agents which specifically bind p53-specific DNA. Also wild-type p53 gene function may be restored to neoplastic cells having a mutation in their p53 gene. See also AAQ31949-84. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wild-type p53 protein binds specific fragments of human chromosomal DNA. Bach fragment contains no more than one monomer of the double stranded sequence shown separated by 0-13 base pairs. Some of these sequences are found near the origin of replication of certain animal viruses and animal cells. Four mutant forms of p53 protein which are commonly found in human cells. Four mutant forms of p53 protein which are commonly found in human function of p53 may be mediated by its ability to bind specific DNA sequences in the human genome. The sequence shown is a consensus sequence for p53 DNA binding. When inserted upstream and adjacent to a reporter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection and expression of wild type P53 protein - useful for diagnosing and treating cancers, and for screening potential chemotherapeutic agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a consensus binding motif found in human nerve growth factor (NRCP) promoter regions. These can be used to screen for and characterise compounds able to modulate transcription from the hNGF promoters. Such compounds are useful in the treatment of e.g. promoters. The compounds which modulate transcriptional activity of endogenous NGF promoters, especially in the brain, can more easily pass through the blood-brain barrier than exogenously administered
                                                                                                                                                                                                                                                                                                                                                                       NGF; nerve growth factor; treatment; promoter; neurodegenerative disease; consensus binding motif; ds.
           construct could be used for diagnosis of p53 mutations and onset and development of various cancers. The construct may also be used to screen potential chemotherapeutic agents and to identify agents which specifically bind p53-specific DNN. Also wild-type p53 gene function may be restored to neoplastic cells having a mutation in their p53 gene. See also AAQ31949-84. (Updated on 25-MAR-2003 to correct PN field.)
the sequence allows identification of wild type p53, and such a

The present p53 binding site motif can be found in the human bax promoter, i.e. nucleotides -1885 to -1 of the bax gene. Bax expression in a cell plays a central role in apoptosis. The control elements of the DNA encoding this protein are poorly understood. In certain autoimmune diseases, e.g. Alzheimer's or Parkinson's disease or strokes, a high level of cell death occurs and conversely in certain cancers, apoptosis is reduced. The promoter and its related molecules are useful for researching the rest of the controlling elements, and in assays for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is given in a specification relating to an isolated KLB6 Autoantigen Related Protein (KARP-1) nucleic acid molecule. The KARP-1 nucleic acid and KARP-1 protein are useful for the treatment and/or diagnosis of diseases such as cancer and immune deficiency disorders. They are useful in combination with a KARP-1 inhibitor that inhibits double stranded DNA base repair. Inhibitors of KARP-1 are useful in the diagnosis or treatment of conditions characterised by the loss of KARP-1 activity and in the treatment of cancer, e.g. biliary tract cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KARP-1; Ku86 autoantigen related protein; cancer; p53 binding site;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                        The present p53 binding site motif can be found in the human bax promoter, i.e. nucleotides -3885 to -1 of the bax gene. Bax expression in a call plays a central role in apoptosis. The control elements of the DNA encoding this protein are poorly understood. In certain autoimmune diseases, e.g. Alzheimer's or Parkinson's disease or strokes, a high level of cell death occurs and conversely in certain cancers, apoptosis is reduced. The promoter and its related molecules are useful for researching the rest of the controlling elements, and in assays for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; bax promoter; apoptosis; autoimmune disease; cancer;

The present invention describes a method of inhibiting cell proliferation or cell cycle progression, involving providing eukaryotic cells with a bacterial toxin and an antidote to said toxin under appropriate control for selective cell cycle inhibition or killing of target cells. This is useful in the treatment of cancer, arteriosclerosis, psoriasis and other hyperproliferative diseases, in the production of male sterile, seedless and disease resistant plants, and in the production of animal knock-outs which enable the study of organogenesis and developmental control. The present sequence is the p53 binding sequence which is described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacterial toxin; antidote; cell death; apoptosis; developmental control; organogenesis; cancer; psoriasis; arteriosclerosis; knock-out; seedless fruit; male sterility; proteic killer gene system; ds.
                                                                                                                                                                                                                                                                                                                                             Inhibiting cell proliferation and/or cell cycle progression used treating tumors, cancer and psoriasis, involves using toxins and toxin/antidote system based on bacterial system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is given in a specification relating to an isolated KM86 Autoantigen Related Protein (KARP-1) nucleic acid molecule. The KARP-1 nucleic acid and KARP-1 protein are useful for the treatment and/or diagnosis of diseases such as cancer and immune deficiency disorders. They are useful in combination with a KARP-1 inhibitor that inhibits double stranded nN base repair. Inhibitors of KARP-1 are useful in the diagnosis or treatment of conditions characterised by the loss of KARP-1 activity and in the treatment of cancer, e.g. biliary tract cancer

                                                                                                                                                                                                                                               or cell cycle progression, involving providing eukaryotic cells with a bacterial toxin and an antidote to said toxin under appropriate control for selective cell cycle inhibition or killing of target cells. This is useful in the treatment of cancer, arteriosclerosis, psoriasis and other hyperproliferative diseases, in the production of male sterile, seedless and disease resistent plants, and in the production of animal knock-outs which enable the study of organogenesis and developmental control. The present sequence is the p53 binding sequence which is described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting/quantifying DNA binding factors in a sample, or determining activity of DNA binding factors, involves combining two sets of nucleic acid components (NCs) with sample, where each NC comprises DNA binding element (DE), one NC is labelled with fluorescence donor and other NC labeled with fluorescence acceptor, to emit light at unique wavelength and detecting DNA binding factors-DE
                                                                             for

binding by proximity-based luminescence detection. The method is useful for detecting or quantifying DNA binding factors in a sample and for determining the activity of DNA binding factor. The method is useful for determining the amount of an analyte in a sample, where the association of DNA binding factors and DE is mediated by the analyte e.g. secondary messenger molecule (e.g. cAMP), cellular event, drug agent, reagent, prospective drug, prospective agent and prospective reagent. The method is also useful for diagnosing a disease mediated by a DNA binding factor in a human patient who is suffering from a type of cancer or disease of genome instability. The methods are useful for detecting mediating analytes, to diagnose diseases, and/or to screen for drugs that mediate the activity of DNA binding factors. The method is inexpensive, simple and is compatible with high-throughput detection formats. The present sequence represents the consensus p53 recognition sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of detecting/quantifying DNA binding factors in a sample, or determining activity of DNA binding factors, involves combining two sets of nucleic acid components (NCB) with sample, where each NC comprises DNA binding element (DE), one NC is labelled with fluorescence donor and other NC labeled with fluorescence donor and other NC labeled with fluorescence acceptor, to emit light at unique wavelength and detecting DNA binding factors. DE binding by proximity-based luminescence detection. The method is useful for detecting or quantifying DNA binding factors in a sample and for determining the activity of DNA binding factors in a sample and for determining the amount of an analyte in a sample, where the association of DNA binding factor and DE is mediated by the analyte e.g. secondary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting or quantifying sample DNA binding factors, or determining activity of DNA binding factor, by detecting binding of DNA binding factor with DNA binding element by proximity-based luminescence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     p53; ds; genome instability disease; cancer; DNA binding factor; proximity-based luminescence detection.

The JFV1 polynucleotide is useful for inducing rapid apoptosis in cancer cells, for treating cancers or other diseases characterised by unwanted cellular proliferation, and as a substitute for p53 in cancer gene therapy. The expression product of JFV1 may be used as an indicator for neoplastic cancer cells and in determining the prognosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New JFY1 proteins and nucleic acids, useful for inducing rapid apoptosis in cancer cells, for treating cancers or other diseases characterized by unwanted cellular proliferation, and as a substitute for p53 in cancer
             prospective drug, prospective agent and prospective reagent. The method is also useful for diagnosing a disease mediated by a DNA binding factor in a human patient who is suffering from a type of cancer or disease of genome instability. The methods are useful for detecting mediating analytes, to diagnose diseases, and/or to screen for drugs that mediate the activity of DNA binding factors. The method is inexpensive, simple and is compatible with high-throughput detection formats. The present

and purified JFV1 protein. The JFV1 polynucleotide is useful for inducing rapid apoptosis in cancer cells, for treating cancers or other diseases characterised by unwanted cellular proliferation, and as a substitute for p53 in cancer gene therapy. The expression product of JFV1 may be used as an indicator for neoplastic cancer cells and in determining the progness of a cancer patient. The present sequence represents a human JFV1, p53-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New JFY1 proteins and nucleic acids, useful for inducing rapid apoptosis in cancer cells, for treating cancers or other diseases characterized by unwanted cellular proliferation, and as a substitute for p53 in cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated and purified JFY1 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PRG; p53 target; human; p53-responsive element; cell proliferation;

```
located on PRG target molecules, that are modulated on induction by p53 activity. The tumour suppressor gene p53, functions as a transcription factor and interacts with this responsive element and activates transcription from the promoter. PRG sequences are potential targets of p53 regulatory activity and are useful for modulation of cellular proliferation. It has cytostatic and immunomodulatory activity. PRG polynucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for detection and treatment of cancer and other proliferative diseases. The gene/CDNA may be used for gene therapy, to restore a gene function downstream of p53, that cannot be activated in the p53-deficient tumour cell. Antibodies can be used as inducers of cell sycle arrest and/or apoptosis. The DNA sequences can be used to generate 'knockout' animals as a model of cancer susceptibility
                                                                                                                                                                                                                                                               New p53-inducible isolated nucleic acid molecule including open reading frame encoding human homolog of Drosophila melanogaster peroxidasin, useful e.g. in detection and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, generic p53 DNA binding site consensus sequence; ss; chromosomal immunoprecipitation; Chip, target gene discovery; coding sequence discovery; regulatory element discovery; transcription factor discovery; screening; highly automatable;
                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the p53-responsive element consensus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 10; DB 3; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the p53-responsive element consensus sequence, located on PRG target molecules, that are modulated on induction by p53 activity. The tumour suppressor gene p53, functions as a transcription factor and interacts with this responsive element and activates transcription from the promoter. PRG sequences are potential targets of p53 regulatory activity and are useful for modulation of cellular proliferation. It has cytostatic and immunomodulatory activity. PRG polymucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for detection and treatment of cancer and other proliferative diseases. The gene/CDNA may be used for gene therapy, to restore a gene function downstream of p53, that cannot be activated in the p53-deficient tumour cell. Antibodies can be used as inducers of cell content and or approprials. The DNA sequences can be used to generate the p53-deficient tumour cell. Antibodies can be used to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New p53-inducible isolated nucleic acid molecule including open reading frame encoding human homolog of Drosophila melanogaster peroxidasin, useful e.g. in detection and treatment of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                         immunoprecipitation (Chip) procedures for the discovery and characterisation of transcription factor target genes. The method of the invention is useful for the discovery and characterisation of transcription factor target genes. The method is preferably useful for the discovery and characterisation of: target genes (e.g. coding sequences and regulatory elements); and DNA binding transcription factors. The DNA sequences isolated by the method of the invention are useful for cross-hybridising against libraries of nucleotide sequences, and for screening against arrays of nucleotide sequences, the invention is highly automatable, allowing for extensive high-throughput analysis of virtually any genetic cascade. The present DNA
                                                                                 Utilizing sequential chromosomal immunoprecipitation for discovery and characterization of target genes for transcription factors which are of DNA binding nature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Utilizing sequential chromosomal immunoprecipitation for discovery and characterization of target genes for transcription factors which are of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence represents a generic p53 DNA binding site consensus sequence

The invention further relates to compositions and methods based on RTVP for the treatment, prevention and detection of prostatic neoplasia such as prostate carcinoma and associated metastatic disease. Diagnostic kit composition protein is useful for the detection of neoplastic kit disease. Composition comprising RTVP protein is useful in the diagnosis, studying and treatment of prostatic neoplasia such as prostatic carcinoma and associated metastatic disease. It is also useful for stimulating immune system e.g. cytokines and growth factors in a patient. The present sequence is p53 consensus binding site DNA used in the identification of
                characterisation of transcription factor target genes. The method of the invention is useful for the discovery and characterisation of transcription factor target genes. The method is preferably useful for the discovery and characterisation of: target genes (e.g. coding sequences and regulatory elements); and DNA binding transcription factors. The DNA sequences isolated by the method of the invention are useful for cross-hybridising against libraries of nucleotide sequences, and for screening against arrays of nucleotide sequences. The method of the invention is highly automatable, allowing for extensive high-throughput analysis of virtually any genetic cascade. The present DNA sequence represents a generic p53 DNA binding site consensus sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel testes-specific, vespid and pathogenic polypeptide useful for treating and preventing prostatic neoplastic diseases, such as prostatic carcinoma and metastatic carcinoma, has antineoplastic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Testes-specific, vespid and pathogenic protein; RTVP; therapy; anti-neoplastic; prostatic neoplasia; prostate carcinoma; cytokine; metastatic disease; neoplastic disease; immune system; growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a gene encoding non-human testes-specific, vespid and pathogenic protein (RTVP) having anti-neoplastic activity. The invention further relates to compositions and methods based on RTVP for the treatment, prevention and detection of prostatic neoplasia such as prostate carcinoma and associated metastatic disease. Diagnostic kit disease. Composition comprising RTVP protein is useful in the diagnostic kit studying and treatment of prostatic neoplasia such as studying and treatment of prostatic neoplasia such as prostatic carcinoma and associated metastatic disease. It is also useful in the diagnosis, and associated metastatic disease. It is also useful for stimulating immune system e.g. cytokines and growth factors in a patient. The present sequence is p53 consensus binding site DNA used in the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel testes-specific, vespid and pathogenic polypeptide useful for treating and preventing prostatic neoplastic diseases, such as prostatic carcinoma and metastatic carcinoma, has antineoplastic activity.

This invention relates to novel agents which regulate the induction of apoptosis by p53 or p73 by formation of a heterooligomer with deltaNp73. The invention may have cytostatic activity by acting as an agonist or antagonist of p73 and p53 transcription. Agents which regulate the induction of apoptosis by p53 or p73 are useful for treatment and prevention of cancer, including neuroblastoma. The present sequence is that of a degenerate DNA sequence which is related to the invention.
                                                                                                                                                                                                                                         Gaps

```
The present sequence is the p53 binding consensus sequence, constructed from the five potential p53 responsive elements (A-B) located on PRG target molecules. They are modulated on induction by p53 activity. The tumour suppressor gene p53, functions as a transcription factor and interacts with this responsive element and activates transcription from the promoter. PRG sequences are potential targets of p53 regulatory activity and are useful for modulation of cellular proliferation. It has cytostatic and immunomodulatory activity. PRG polymucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for detection and treatment of cancer and other proliferative diseases. The gene/GDNA may be used for gene therapy, to restore a gene function downstream of p53, that cannot be activated in the p53-deficient tumour cell. Antibodies can be used as inducers of cell cycle arrest and/or apoptosis. The DNA sequences can be used to generate 'knockout' animals a model of cancer susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New p53-inducible isolated nucleic acid molecule including open reading frame encoding human homolog of Drosophila melanogaster peroxidasin, useful e.g. in detection and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 consensus; immunomodulatory; cytostatic; gene therapy; inducer; cancer; tumour cell; diagnosis; therapsutic; proliferative disease; apoptosis; cell cycle arrest; modulate; treatment; knockout animal; cancer susceptibility; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                       This invention relates to novel agents which regulate the induction of apoptosis by p53 or p73 by formation of a heterooligomer with deltaNp73. The invention may have cytostatic activity by acting as an agonist or antagonist of p73 and p53 transcription. Agents which regulate the induction of apoptosis by p53 or p73 are useful for treatment and prevention of cancer, including neuroblastoma. The present sequence is that of a degenerate DNA sequence which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PRG; p53 target; human; p53-responsive element; cell proliferation; consensus; immunomodulatory; cytostatic; gene therapy; inducer; cancer; tumour cell; diagnosis; therapeutic; proliferative disease; apoptosis; cell cycle arrest; modulate; treatment; knockout animal; cancer susceptibility; ds.

The sequence is that of the human papilloma virus (HPV) E6 consensus negative strand primer WD163 which was used in the amplification by PCR of HPV DNs. It may be used as part of a simple and rapid assay method for detecting and typing HPV in biological samples. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š
                               The present sequence is the p53 binding consensus sequence, constructed from the five potential p53 responsive elements (A-E), located on PRG target molecules. They are modulated on induction by p53 activity. The tumour suppressor gene p53, functions as a transcription factor and interacts with this responsive element and activates transcription from the promoter. PRG sequences are potential targets of p53 regulatory activity and are useful for modulation of cellular proliferation. It has cytostatic and immunomodulatory activity. PRG polymucleotides, proteins and antibodies are useful as diagnostic and therapeutic agents for gene/DDNA may be used for gene therapy, to restore a gene function downstream of p53, that cannot be activated in the p53-deficient tumour constream of p53, that cannot be activated in the p53-deficient tumour apoptosis. The DNA sequences can be used to generate 'knockout' animals as model of cancer susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the human papilloma virus (HPV) E6 consensus negative strand primer WD163 which was used in the amplification by PCR of HPV DNA. It may be used as part of a simple and rapid assay method for detecting and typing HPV in biological samples. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of genital human papilloma virus - by PCR amplification using defined consensus primer pairs.

The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 16, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the 11, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. Is done with probes derived from consensus sequences found in all characterised HPV sequences. The negative strand primers AAT44821-6 are used with positive strand primers (AAT4813-6) to amplify short fragments of 225-250 bp from the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AAT44839-40, specific for these short fragments. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                        Nucleic acid hybridisation probes - specific for selected human papilloma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 3. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 6, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the Li, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. The negative strand primers AAT44812-6 are used with positive the E6 region of HPV types 6, 11, 16, 18 and 33. The amplified fragments are detected using the E6 consensus probes AAT44839-40, specific fragments are detected using the E6 consensus probes AAT44839-40, specific fragments these short fragments. (Updated on 25-MAR-2003 to correct PF field.)

The present invention describes a gene (I) encoding a ribozyme prodrug comprising an intervening sequence removable by splitcing, and/or lacking Comprising at intervening sequence removable by splitcing, and/or lacking RNA-cleaving activity. Also described are: (i) an expression vector comprising (I) and preferably further comprising a tissue-specific promoter; (ii) a ribozyme prodrug comprising an intervening sequence in the ribozyme sequence removable by splitcing, and lacking RNA-cleaving activity, (iii) a drug composition comprising (I), and (iv) the in vivo production of mature ribozyme with RNA-cleaving activity by introducing (I) into a eukaryote. (I) has antivital, cytostetic, antiallergic and immunosuppressive activities, and can be used in ribozyme and gene therapy. The ribozyme prodrug is useful e.g. in gene therapy, particularly for treating viral infections such as AIDS and those due to heptitis B virus (HBV) and hepatitis C virus (HCV), cancers including those of the liver, pancreas and colon, and leukaemia, and diseases. Caused by genetic defects such as allergy, autoimmune diseases.
                                                                            numan papillomavirus (HPV) E6 negative strand on 25-MAR-2003 to correct PF field.) (Updated

The present invention describes a gene (I) encoding a ribozyme prodrug comprising an intervening sequence removable by splicing, and/or lacking RNA-cleaving activity. Also described are: (i) an expression vector comprising (I) and preferably further comprising a tissue-specific promoter; (ii) a ribozyme prodrug comprising an intervening sequence in the ribozyme sequence removable by splicing, and lacking RNA-cleaving activity; (iii) a drug composition comprising (I); and (iv) the in vivo production of mature ribozyme with RNA-cleaving activity; (iii) a drug composition comprising (I); and (iv) the in vivo production of mature ribozyme with RNA-cleaving activity by introducing (I) into a eukaryote. (I) has antiviral, cytostatic, antiallergic and immunosuppressive activities, and can be used in ribozyme and gene therapy. The ribozyme prodrug is useful e.g. in gene therapy, particularly for treating viral infections such as AIDS and those due to hepatitis B virus (HBV) and hepatitis C virus (HCV), cancers including those of the liver, pancreas and colon, and leukaemia, and diseases caused by genetic defects such as allergy, autoimmune diseases, familial sequence in the ribozyme sequence which can be spliced off in cytoplasm sequence in the ribozyme sequence which can be spliced off in cytoplasm
                                                                                                                                                                                                    ö
                   without RNA-cleaving activity, is encoded by a gene with an intervening sequence in the ribozyme sequence which can be spliced off in cytoplasm to give a functional ribozyme. The present sequence is used in the
